Understanding Pointer&Struct Basics

Code

```
#include <iostream>
#include <string>
using namespace std;
struct Student { //建立一個名為Student的結構型態,裡面包含int、string等不同類型的資料型態
    int id;
    string name;
    int chinese;
    int english;
    int math;
    int social;
    int science;
};
void updateMath(Student *s) { //接收address要加*
    s->math = 100; //把點改成箭頭
}
void printStudent(Student *s) { //接收address要加*
    cout << "學生編號: " << s->id << endl; //把點改成箭頭
    cout << "姓名: " << s->name << endl; //把點改成箭頭
    cout << "數學成績: " << s->math << endl; //把點改成箭頭
}
int main() {
    Student one;
    //利用前面所建立的名為Student的結構來宣告一個名為one的結構變數
    one.id = 1; //對新宣告的結構變數one中的元素賦值
    one.name = "張小美";
    one.chinese = 77;
    one.english = 83;
    one.math = 86;
    one.social = 68;
    one.science = 91;
    updateMath(&one); //加&變call by address
    printStudent(&one); //加&變call by address
    return 0;
}
```

Discussion Section

當我是call by value時, 使用某個struct裡面的參數需要用點, 像是one.math。
但如果我是call by address時, 需要用箭頭->來引用某個struct的參數
